DP (Dynamic programming)

1. DP1. Introduction to Dynamic programming | Memoization | Tabulation | Space optimization Techniques
2. DP2. Climbing Stairs | Learn How to write 1D Recurrance Relations
3. DP3. Frog Jump | Dynamic programming | Learn to write 1D DP
4. DP4. Frog Jump with K distance | lecture 3 follow up question
5. DP5. Maximum sum of Non-adjacent elements | House Robber | 1-D | DP on subsequences
6. DP6. House Robber 2 | 1D DP | DP on Subsequences
7. DP7. Ninja's Training | Must for 2D concepts | 2D DP
8. DP8. Grid unique path | Learn everything about DP on Grids | All Techniques
9. DP9. unique paths2 | DP on Grid with Maze obstacles
10. DP10. Minimum path sum in Grid | DP on Grids | Asked in Microsoft
11. DP11. Triangle | fixed starting point and variable ending point | DP on Grids
12. DP12. Minimum/Maximum falling path sum | Variable starting and ending point | DP on Grids
13. DP13. Cherry pickup II | 3D DP made Easy | DP on Grids
14. DP14. Subset sum Equal k to Target | Identify DP on subsequences and ways to solve them
15. partition Equal Subset sum | DP on subsequences
16. Partition A set into Two Subsets with minimum Absolute sum Difference DP on subsequences
17. Count Subsets with sum K | DP on subsequences
18. Count partitions with given difference | DP on Subsequences
19. 0/1 Knapsack | Recursion to strivers array space optimization approach | DP on subsequences
20. Minimum coins | DP on Subsequences | Infinite Supplies pattern
21. Target Sum | DP on subsequences
22. DP22. Coin Change 2 | Infinite supplies pattern | DP on subsequences
23. DP23. Unbounded Knapsack | 1-D Array space optimised Approach
24. DP24. Rod cutting problem | 1-D Array space optimised approach
25. DP25. Longest Common subsequences | Top-down | Bottom-up | Space optimised | DP on String
26. DP26. print longest Common subsequences | DP on string

27. DP27. Longest Common Substring | DP on string
28. DP28. Longest palindromic subsequences |
29. DP29. Minimum insertions to make string palindrome
30. DP30. Minimum insertions | Deletions to cover string A to string B
31. DP 31. Shortest common subsequences | DP on strings
32. DP32. Distinct subsequences | 1D Array Optimization Technique
33. DP 33. Edit distance | Recursive to 1D Array optimised solution
34. DP34. Wildcard matching | Recursive to 1D Array optimisation
35. DP35. Best time to Buy and sell stocks | DP on stocks
36. DP36. Buy and sell stocks - II | Recursion to space optimisation
37. DP37. Buy and sell stocks - III | Recursion to space optimisation
38. DP 38. Buy and sell stocks - IV | Recursion to space optimisation
39. DP39. Buy and sell stocks with cooldown | Recursion to space optimization
40. DP40. Buy and Sell stocks with Transaction Fee | Recursion to space optimisation
41. DP41. Longest increasing subsequence | Memoization
42. DP42. Printing Longest increasing subsequences | Tabulation | Algorithm
48. DP43. Longest increasing subsequence | Binary search | Intution
44. DP44 Largest divisible subset | Longest increasing subsequences
45. DP45. Longest String chain | Longest increasing subsequence | LIS
46. DP46. Longest Bfot Bitonic subsequence | LIS
47. DP47. Number of Longest increasing subsequences
48. DP48. Matrix chain Multiplication | MCM | partition DP starts
49. DP49. Matrix chain Multiplication | MCM | Bottom-up | Tabulation
50. DP50. Minimum cost to cut the stick |
51. DP51. Burst Ballons | partion DP |
52. DP52. Evaluate Boolean Expression to True | partion DP
58. DP53. palindrome partitioning - II | Front partition
54. DP54. partition array for Maximum sum | Front partition
55. DP55. Maximum Rectangle area with all 1's | DP on Rectangles
56. DP56. Count Square Submatrices with All ones | DP on Rectangles

DP (Dynamic programming)

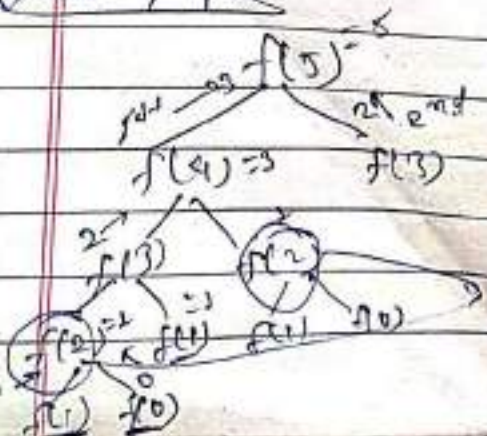
$f(n) = f(n-1) + f(n-2)$

$f(4) =$

F(n) Recursion

```
{
  if(n<=1)
    return n;
  return f(n-1) + f(n-2);
}
```

Recursion tree

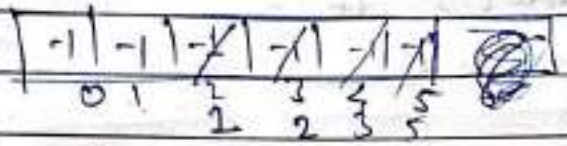


f(4) →
f(3) →

overlapping sub problem
Memoization

PAGE NO.:
DATE: / /

Memorization) → tend to store the value of sub problems in some map/table.



Initialy = -1

dp[n+1]

```
f(n)
{
  if (n<=1)
    return n;
  if(dp[n] != -1)
    return dp[n];
  return f(n-1) + f(n-2); (1)
}
```

① convert Recursion into Memorization.

②

dp[n]

Recursion → DP

3 Steps

declearse a dp array
size of sub problem i.e. n

Step 1 : Storing the answer which is being computed for every subproblem. will

Step 2 : Checking if the subproblem has been previously solved. if it is previously solved then the value will not be -1.

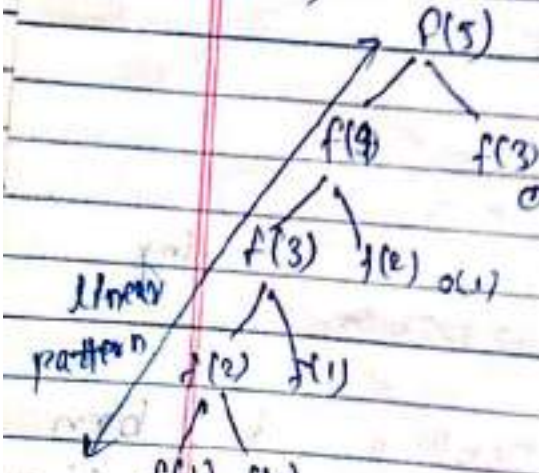
Step 3 :

@Aashish Kumar Nayak

```
int f( int n , vector<int> &dp )
{
    if(n<=1 )
        return n;

    if( dp[n] != -1)
        return dp[n];

    return dp[n] = f(n-1, dp ) + f(n-2 , dp);
}
int main()
{
    int n;
    cin>>n;
    vector<int> dp(n,-1);
    cout<< f(n,dp);
    return 0;
}
```



TC = O(N)

SC = O(N) + O(N)

PAGE NO.:
DATE: / /

Recursion → Tabulation (Bottom - Up)
(Top down)
(Base case to the required)

* Answer require to base case

dp[n+1]

dp[0] = 0 dp[1] = 1

```
for(i=2; i<=n ; i++)
    {
    dp[i] = dp[i-1] + dp[i-2];
    }
```

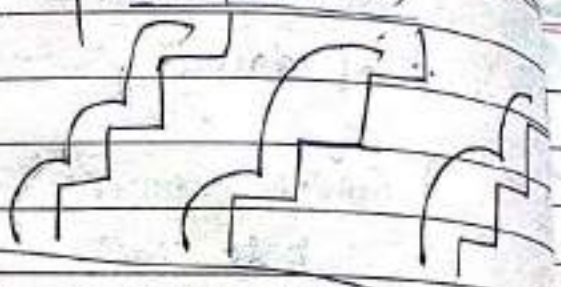
Best solution (space optimization)

```
int main()
{
int n;
cin>>n;
int prev2 = 0;
int prev1 = 1;
for(int i=2; i<=n; i++)
    {
    int curr = prev + prev2
    prev2 = prev;
    prev = curr;
    }
cout<< prev;
```

Intuitive solution

@Ashish Kumar Nayak

Climbing stairs problem | 1D problem



n = 3

* understand a DP problem :-

1. concept of try all possible way
   - Count
   - Best way
2. count the total no. of ways.
3. Optimal solution (min, max)

Then try to apply recursion all possible ways

Jwp.

Shortcut

1. Try to represent the problem in terms of index.
2. Do all possible stuff on that index according to the problem statement.
3. If question say count all ways then sum of all stuff.
4. min (of all stuff) → find min

@Aashish Kumar Nayak

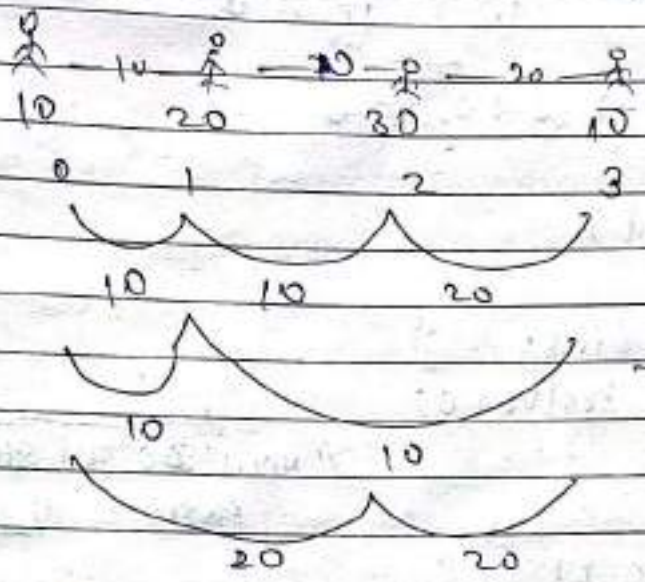
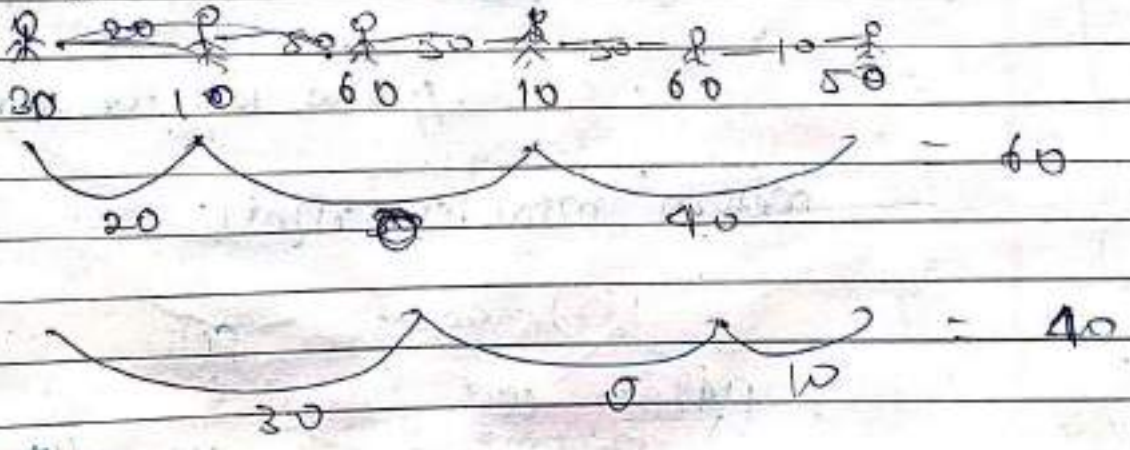
Frog JUMP problem :-



All possible ways, best ways - Means Recursion / DP

Why a greedy algo does not works ?



Greedy fails here, so we have to try Recursion.

Recursion → Try all possible ways.

↓

(min energy)

Step 1: index

Step 2: Do all steps on that index acc. to question.

Steps: Take @ the min (all steps).

@ Aashish Kumar Nayak

PAGE NO.:
DATE: / /

f(n-1) → min energy required to reach (n-1) from 0.

f(0) → (0 → 0) = 0

```
f(ind)
{
  if(ind == 0)
    return 0;
```

// Now DO all stuffs on the index +1 or +2 jump

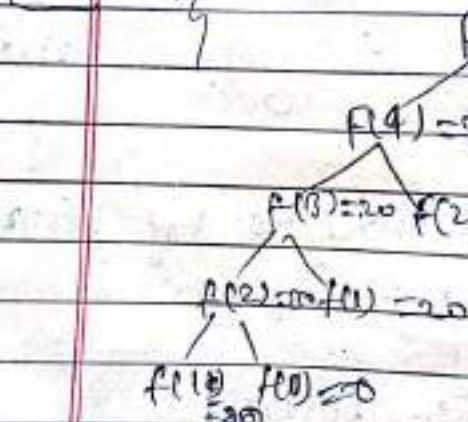
Recursive code

```
left = f(n-1)
  left = f(ind-1) + abs(a[ind] - a[ind-1]);

  if(ind > 1)
  {right = f(ind-2) + abs(a[ind] - a[ind-2]);
  }

// Now take the minimal

return min(left, right);
}
```



f(5)

left = f(4) + |10| = 40

right = f(3) + |40| = 60

min(40, 60)

= 40

and so, on

Aashish kumar Nayak

0	1	2	3	4	5
30	10	60	10	60	50

PAGE NO:
DATE: / /

f(1)
{
left = f(0) + arr(20)
right = INT_MAX ——— ∵ ind ≯ 1 of arr
return (20, INT_MAX);
}
∴ f(1) = 20

f(2)
{
left = f(1) + (50) : = 70
right = f(0) + (30) : = 30
return (70, 30)
}
∴ f(2) = 30

f(3)
{ left = f(2) + (50) : = 80
right = f(1) + (0) = 20
return (80, 20) ∴ f(3) = 20
}

f(4)
{ left = f(3) + (50) = 70
right = f(2) + (0) = 30
return (70, 30)
}
f(4) = 30

f(5)
{ left = f(4) + (10) = 40
right = f(3) + (40) = 60
return (40, 60); ∴ f(5) = 40 Ans
}

DATE: / /

How to convert Recurence into DP

Recurence → DP

Memoization → look at the parameters are changing.

ind is changing

∵ Max size of ind is 5

∴ 5+1 = 6

dp[6]

Step1: declare an array of size n+1

```
dp[n+1] := -1
```

Step2: Before returning add it up. Store it and return.

```
return dp[ind] = min(left, right);
```

Step3: Check if it is previously computed or not.

```
if(dp[ind] != -1)
    return dp[ind];
```

TC → O(N)

SC → O(N) + O(N)

Recursion array

@Ashish Kumar Nayak

...ning the subsequence

Let's code

```
int ff(int ind, vector<int> &height, vector<int> &dp):
{
    if(ind==0)
        return 0;
    if(dp[ind]!=-1) return dp[ind];
    int left = f(ind-1, height, abs(height[ind] - height[ind-1]);
    int right = INT_MAX;
    if(ind>1)
    {
        right = f(ind-2, height, abs(height[ind] - height[ind-2]);
    }
    return dp[ind] = min(left, right);
}
```

Only some test case will pass & T.L.E.

```
int frogjump(int n, vector<int> &height)
{
    vector<int> dp(n+1, -1);   — (1) Step
    return f(n-1, height, dp)
}
```

Now optimized Memoization.

TC:
TC → O(N)
SC → O(N) + O(N)
(recursion) (array dp)

Step 1: declare dp
dp[n+1]

Step 2: Store it and return (overlapping sub problem)
return dp[ind] = min(left, right);

Step 3: Check if it is previously computed or not
if(dp[ind]!=-1)
return dp[ind];

@Aashish Kumar Nayak

DATE: / /

Memoization (Top-down) — Tabulation (Bottom-up)

Tabulation Method

int dp[n] → for zero based index

```
int frogJump(int n, vector<int> &heights)
{
    vector<int> dp(n, 0);
    dp[0] = 0;
    for(int i=1; i<n; i++)
    {
        int fs = dp[i-1] + abs(height[i] - height[i-1]);
        int ss = INT_MAX;
        if(i>1)
        {
            ss = dp[i-2] + abs(height[i] - height[i-2]);
        }
        dp[i] = min(fs, ss);
    }
    return dp[n-1];
}
```

T.C → O(N)

S.C → O(N) + O(N) (Recursion reduced)

O(N) — array dp

space optimization

PAGE NO.:
DATE: / /

```
int frogJump(int n, vector<int>& height)
{
    int prev = 0;
    int prev2 = 0;

    for(int i = 1; i < n; i++)
    {
        int fs = prev + abs(height[i] - height[i-1]);
        int ss = INT_MAX;
        if(i > 1)
            ss = prev2 + abs(height[i] - height[i-2]);

        int curi = min(fs, ss);
        prev2 = prev;
        prev = curi;
    }
    return prev;
}
```

$TC = O(N)$

$SC = O(N) + O(N)$ ~~array dp~~ ~~Recursion~~

$\therefore SC = O(1)$ both are reduced

Aapshish kumar Nayak

PAGE NO:
DATE: / /

Recurrence & Code

```
f(ind)
{
  if(ind == 0)
    return 0;

int minSteps = INT_MAX;
  for(int j=1; j<=k ; j++)
{
    if( ind-j >=0)
    {
    Jump = f(ind-j) + abs(a[ind] - a[ind-j]
    minSteps = min( min_steps, jump);
    }
```

Now Memoize the code

```
f(ind)
```

Tabulation

```
if{   int dp[n];
      dp[0] = 0;
  for(int i=1; i<n; i++)
    {
        for( j
    int min_steps = INT_MAX;
    for( j=1; j<=k; j++)
      { if(i-j>=0)
      }
    Jump = dp[i-1] + abs(a[i] - a[i-j]
    Min steps = Min( Min_steps, jump);
```

dp[i] = min_steps;

}

print [dp[n-1]];

T.C → O(N×K)

S.C → O(N)

Can't optimize further as S.C - O(K) + O(N)

MAXIMUM SUM OF NON-ADJACENT ELEMENTS

Let's try out all subsequences with the given constraints

Try out all means Recursion.

↓

pick the one with maximum sum.

Print all subsequences

↳ pick/Non-pick

1. Index
2. Do stuff
3. return the best you can get

Pick subsequence with no adjacent element.

DP-15

Partion Equal Subset Sum

{2, 3, 3, 3, 4, 5}

{2, 3, 5} Subset 1

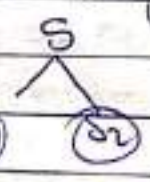
{3, 3, 4} Subset 2

Subset with n sum

Exactly 2 subset

$S_1 = S_2$

Entire array sum = S



$S_1 = S_2 = S/2$

S = total sum

if S = odd → (X) not possible

if S = even

then look for target sum $\frac{S}{2}$

If one subset you got ($\frac{S}{2}$) then you already got 2nd subset.

NOW this question converts into

arr → [ ]

subset sum = $S/2$

where

S = total sum of given array.

2/6 = 0 ans should be 2+1 = 3 but

2/5 = 0 if we choose 6 & 5 ans = 2

2/1 = (2) so greedy fails here.

Approach :- Trying out all combos to form target

↓

take the combo that has min coins

Rules :-

1. Express the recurrence in terms of index.
2. Express or do all stuffs.
3. Min. of all.

Recurrence

@Aashish Kumar Nayak

Whenever there is statement like infinite supply, multiple case's it will stand at same index it will not go back.

T.C. -> ??
O(2^T)

S.C. -> O(N) - recursion

```
f(ind, T)
{
if(ind == 0)
  if(T % arr[0] == 0) return T/arr[0];
  else return 1e7;

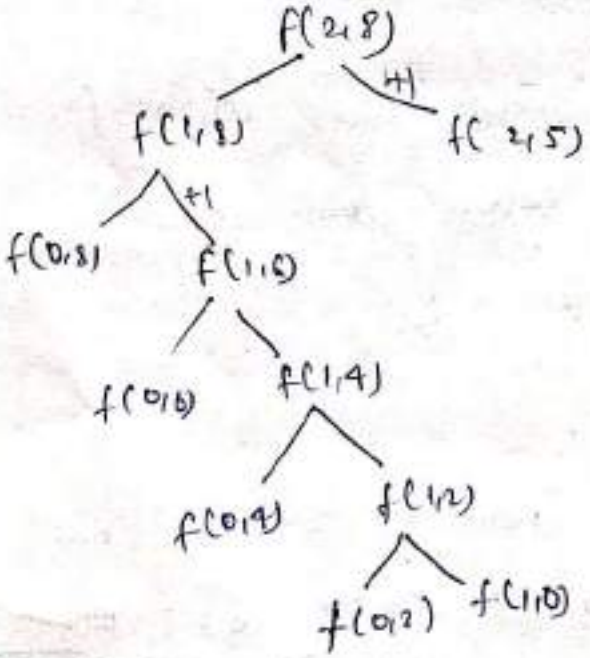
int not_take = 0 + f(ind-1, T);
int take = INT_MAX;
if(coins[ind] <= T)
   take = 1 + f(ind, T-coins[ind]);
return min(take, NOTtake);
}
```

X [6] target = 7
arr[0]

✓ [7] target = 7

[4] target = 12

Base case



T.C. -> >> O(2^T)
S.C. -> >> O(N)

Seem Exponential.

Now we will Memoize it,

changing parameters -> ind, target

dp[ind][target] = ?

T.C. : O(N*T)
S.C = O(N*T) + O(T) Auxiliary Stack

@Aashish Kumar Nayak

Tabulation

⇒ Any memoization can be converted into tabulation.

1. Base case
2. find target and write it in opposite fashion.
3. Copy the tarbulance.

for any target

```
for(T=0 → target)
    if(T-1.a[0] == 0)
        dp[0][T] = T/a[0];
    else
        dp[0][T] = INT_MAX;
```

Code :-

```
int f(ind, int T, vector<int> &nums, vector<vector<int>> &dp)
{ if(ind == 0)
  { if(T%nums[0] == 0)
      return T/nums[0];
    return 1e9;
  } if(dp[ind][T] != -1) return dp[ind][T];
int not-take = 0 + f(ind-1, T, nums, dp);
int take = INT_MAX;
if(nums[ind] <= T)
  { take = 1 + f(ind, T-nums[ind], nums, dp);
  }
return min(take, notTake);
  ↳ dp[ind][T] = min(take, not-take);
}
int minimumElements(vector<int> &num, int target)
{ int n = num.size(); vector<vector<int>> dp(n, vector<int>(target+1, -1));
int ans = f(n-1, target, nums, dp);
if(ans >= 1e9) return -1;
return ans;
}
```

@Aashish Kumar Nayak

Tabulation code :-

```
int minimumElements(vector<int>& nums, int target)
{
    int n = nums.size();
    vector<vector<int>> dp(n, vector<int>(target+1, 0));
    for(int T=0; T<=target; T++)
    {
        if(T % nums[0] == 0)
            dp[0][T] = T/nums[0];
        else dp[0][T] = 1e9;
    }
    for(int ind=1; ind<n; ind++)
    {
        for(int T=0; T<=target; T++)
        {
            int notTake = 0 + dp[ind-1][T];
            int take = INT_MAX;
            if(nums[ind] <= T)
            {
                take = 1 + dp[ind][T-nums[ind]];
            }
            dp[ind][T] = min(take, notTake);
        }
    }
    int ans = dp[n-1][target];
    if(ans >= 1e9)
        return -1;
    return ans;
}
```

Space Optimization : (using prev1 & prev2)

```
int minimumElements(vector<int> &nums, int target)
{
    int n = nums.size();
    vector<int> prev(target+1, 0), cur(target+1, 0);
    for(int T=0; T<=target; T++)
    {
        if(T%nums[0] == 0)
            prev[T] = T/nums[0];
        else
            prev[T] = 1e9;
    }

    for(int ind=1; ind<n; ind++)
    {
        for(int T=0; T<=target; T++)
        {
            int notTake = 0 + prev[T];
            int take = INT_MAX;
            if(nums[ind] <= T)
            {
                take = 1 + cur[T-nums[ind]];
            }
            cur[T] = min(take, notTake);
        }
        prev = cur;
    }
    int ans = prev[target];
    if(ans >= 1e9)
        return -1;
    return ans;
}
```

@Aashish Kumar Nayak

Target Sum problem | DP on subsequence

arr[] = {1, 2, 3, 1} Assign +, -

target = 3

+ + - -
1 2 3 1 = 7
1 — 3 — 0 — 1

count all the ways to get target.

- + + -
1 2 3 1 = 3
-1 — 1 — 4 — 3

2 ways

+ - + +
1 2 3 4 = 3

$S_1 - S_2 = D$

sum partition

- + + -
[1 2 3 1]

9 + 2 -1 -1
S_1 S_2
5 - 2 = 3
S_1 S_2

same problem like in DP-19

Code:

```
int targetSum(int n, int target, vector<int>& arr)
{ return countPartition(n, target, arr);
}
int countPartition(int n, int d, vector<int>& arr)
{ int totSum = 0;
  for(auto &it : arr)
      totSum += it;
  if(totSum - d < 0) || (totSum - d) % 2
      return false;
  return findWaysArr, (totSum-d)/2;
}
```

```
int findways(vector<int> &num, int tar)
{
    int n = num.size();
    vector<int> prev(tar+1,0), cur(tar+1,0);
    if(num[0] == 0)
        prev[0] = 2;
    else
        prev[0] = 1;
    if(num[0] != 0 && num[0] <= tar)
        prev[num[0]] = 1;
    for(int sum = 0; sum <= tar; sum++)
    {
        int notTake = prev[sum];
        int take = 0;
        if(num[ind] <= sum)
            take = prev[sum - num[ind]];
        cur[sum] = (notTake + take);
    }
    prev = cur;
}
return prev[tar];
}
```

DP-22 Ways to make coin change

N=3 | 1 | 2 | 3 | target=4

any element can be used any no. of times.

{1, 1, 1, 1} = 4
{1, 1, 2} = 4
{2, 2} = 4
{1, 3} = 4

4 differs

figure out total no. of ways → Try out all the ways
↓
Recursion

```
f( )
{
  Base case — if destination is meet: 1 or 0 else
  f(___
  f(___
  return (__ + __);
}
```

Recurrence :-

1. Express → (ind, T)
2. Explore all possibility → not-take / take } fn all the DP subsequence problem.
3. Sum all possibilities and return.

@ | 1 | 2 | 3 |
0 1 2

f(2, 4) — ind, T

Till index 2, in how many ways can you form 4

@Aashish Kumar Nayak

```
f(ind, T)
{
  if(ind == 0)
  {
    if(T % arr[0] == 0)
      return 1;
    else return 0;
  }
  notTake = f(ind-1, T);
  take = 0
  if(arr[ind] <= T)
    take = f(ind, T-arr[ind]);
  return notTake + take;
}
```

[4] arr[0] — T = 4

[2] — T = 4 ✗

[2] — T = 4 ✓

T = arr[0] pair can be formed.

Memoization will solve this issue →

T.C. = O(N × T)

S.C = O(N × T) + O(target) (auxiliary space ASS)

T.C. ≫ $O(2^n)$ exponential

S.C. ≫ O(N)

standing on the same index.

we are standing at same index.

use Tabulation to optimise ASS

Steps → Tabulation — Bottom-up approach

1. Base case
2. ind (1 — n-1)
   T → (0, T)
3. Copy the recurrence.

```
for(T → 0 → target)
dp[0][T] = (T % arr[0] == 0)
```

Code:

```
long countWaysToMakeChange(int *denomination, int n, int value)
{
  vector<vector<long>> dp(n, vector<long>(value+1, -1));
  return f(n-1, value, denomination, dp);
}
```

```
long f(int ind, int T, int *a, vector<long> &dp){
    if(ind == 0)
        return (T % a[0] == 0); // 1 or 0
    if(dp[ind][T] != -1) return dp[ind][T];
    long notTake = f(ind-1, T, a, dp);
    long take = 0;
        if(a[ind] <= T)
            take = f(ind, T-a[ind], a, dp);
    return dp[ind][T] = take + notTake;
}
```

Tabulation :-

```
long countWaysToMakeChange(int *denomination, int n, int value){
    vector<vector<long>> dp(n, vector<long>(value+1, 0));
    for(int T=0; T<=value; T++){
        dp[0][T] = (T % a[0] == 0);
    }
    for(int ind=1; ind<n; ind++){
        for(int T=0; T<=value; T++){
            long notTake = dp[ind-1][T];
            long take = 0;
            if(a[ind] <= T){
                take = dp[ind][T-a[ind]];
            }
            dp[ind][T] = take + notTake;
        }
    }
    return dp[n-1][value];
}
```

Space optimization

Whenever you see like ind-1, ind. then you can always optimise by using couple of stuffs.

Code :-

```
long countWaysToMake( int *a, int n, int value)
{
    vector<vector<long>> dp(n, vector<long>(value+1, 0));
    vector<vector<
    vector<long> prev(value+1, 0), cur(value+1, 0);
    for(int T=0; T<=value; T++)
    {
        prev[T] = T%a[0]==0;
    }
    for(int ind=1; ind<n; ind++)
    {
        for(int T=0; T<=value; T++)
        {
            long notTake = prev[T];
            long take=0;
            if(a[ind] <= T)
            {
                take = cur[T-a[ind]];
            }
            cur[T] = take + notTake;
        }
        prev = cur;
    }
    return prev[value];
}
```

DP-23 # unbounded knapsack

prerequisite
DP-19 — 0/1 knapsack
| In this there was only one occurrence.

wt → {2, 4, 6}
val → {5, 11, 13}

But here infinite supply of every item. we can pick any one item many times.

Ex ÷
13
wt → 6 11 wt → 4

wt → 6
10 wt → 2 x 2
+ 5x2 = 23

wt → 4 x 2 + wt 2
11x2 + 5 = 27 maximum possible value.

(wt → 2) x 5 = (10) wt
5x5 = (25) val

f(ind, w)
{ if(ind == 0)
return [w/wt[0] x val[0]];

Base case we write for 0

val 10
wt 5
arr[]

w=8 ✓ 2
if w=2 x 0

int (w/wt[0]) x val[0]

notTake = 0 + f(ind-1, w);
take = INT_MIN;
if(arrwt[ind] <= w)
take = val[ind] + f(ind, w - wt[ind]);

return max(take, notTake);

Memoize T.C. — exponential

Tabulation 1. Base case >> O(W)
2. Changing parameter ind
3. copy the recurrance.

@Ashish Kumar Nayak

w can be anything 0, 1, 2, — — — Wt. bag

for(w → 0 to wt.bag)

{ dp[0][w] = $\left(\frac{w}{wt[0]}\right)$ × val[0] ·

}

Code ÷ * Memoized

int f(int ind, int W, vector<int> &val, vector<int> &wt, vector<vector<int>> &dp)

{ int if(ind == 0)

{ return ((int)(W/wt[0])) * val[0];

} if(dp[ind][W] != -1) return dp[ind][W];

int notTake = 0 + f(ind-1, W, val, wt, dp)

int take = 0;

if(wt[ind] <= W)

{ take = val[ind] + f(ind, W - wt[ind], val, wt, dp)

}

return dp[ind][W] = max(take, notTake);

}

int unboundedKnapsack (int n, int w, vector<int> &val,

vector<int> &wt)

{ vector<vector<int>> dp(n, vector<int> (w+1, -1));

return f(n-1, w, val, wt, dp);

}

@Aashish kumar Nayak

Tabulation :-

```
int unboundedknapsack(int n, int w, vector<int> &val,
                      vector<int> &wt)
{
    vector<vector<int>> dp(n, vector<int>(w+1, 0));
    for(int w=0; w<=w; w++)
    {
        dp[0][w] = ((int)(w/wt[0])) * val[0];
    }
    for(int ind=1; ind<n; ind++)
    {
        for(int w=0; w<=w; w++)
        {
            int nottake = 0 + dp[ind-1][w];
            int take = 0;
            if(wt[ind] <= w)
            {
                take = val[ind] + dp[ind][w - wt[ind]];
            }
            dp[ind][w] = max(take, nottake);
        }
    }
    return dp[n-1][w];
}
```

Space optimization

int-1, int → 3D space optimized is possible.

```
int unboundedKnapsack( int n, int w, vector<int> & val,
                       vector<int> & wt)
{
    vector<int> prev(w+1, 0), cur(w+1, 0);
    for(int w=0; w<=w; w++)
        { prev[w] = ((int)(w/wt[0])) * val[0];
    }
    for (int ind=1; ind<n; ind++)
        { for (int w=0; w<=w; w++)
            { int notTake = 0 + prev[w];
              int take = 0;
              if(wt[ind] <= w)
              { take = val[ind] + cur[w-wt[ind]]
                                  //prev[w-wt[ind]];
              }
//prev[w]= max(take,notTake);
              cur[w] = max(take, notTake);
        }
R       // prev = cur; //Remove this line
    }
    return prev[w];
}
```

prev: 3 4 5 6 7 1 2

not take = 3 from cur

take = than we rewrite.

1D array optimization

DP-24 Rod cutting problem | DP on subsequences

N = 5 → Rod length

price array[] = | 2 | 5 | 7 | 8 | 10 |
length: 1 2 3 4 5

For length 1 price = 2 — For length 2 price = 5

We need to cut the rod into pieces

price: 2 2 2 2 2
length: 1 1 1 1 1 = 10

2 | 3 | 3 = 12 ↑↑ maximum

5 | 3 = 12 maximum

We need to print maximum cost.

1 2 3 4 5

Collect rod length to make N

↓

Maximize the price — Similar to knapsack

| 2 | 5 | 7 | 8 | 10 |
0 1 2 3 4

means 4 length — means 5 length

Try to pick lengths and sums them up to make the given N.

↳ In all possible ways.

↳ Recurrence

1. Express in terms of index
2. Explore all possibilities ← not Take / Take
3. Maximize the price or possibilities.

        cur[N] = max(take, notTake);
      }
    prev = cur;
  }
  return prev[n];
}
```

// prev[N-rodLength]

//prev[N-1]

we can do 1D array optimization like previous one.

@Ashish Kumar Nayak

DP on Strings

[DP on strings] → Comparison of strings
→ replace / edit

longest common [subsequences]

s_1 = "adebc" s_2 = "dcadb"

DP-25 **Longest Common Subsequence :-**

abc → [a, b, c, ab, bc, ac, abc, " "]

power set / ~~Rec~~ or recursion ← we can use these ~~two~~ method to print ~~all~~ the subset.

s_1 = "a d e b c" —— 2^5 subsequences

a, d, e, b, c, ad, ae, ac, de, db, dc, adc, —— adb

s_2 = "dcadb" —— 2^5 subsequences

d, c, a, d, b, dc, da, da, db, — — — adb

we have to find all the subsequences and take out the longest one.

Brute force

Generate all subsequences

take one & compare ↓ so on

T.C. :- O(exponential)

New approach

⇒ Generate all subsequences & compare on way.

↓

Recursion method, we will not generate instead we will use parameter to generate them.

We will write some recurrence which give the answer through the way.

@Aaibish Kumar Nayak

Rules to write the recurrence

(i) Express everything in terms of index

(ii) Explore possibilities on that index.

(iii) take the best among them.

Let's take an example

a c d | c e d

if match: ↑ ind1, ↑ ind2

1 + f(ind1-1, ind2-1);

d == d

a c | c e

ind2, ind1

a c | c e ← if not match

a c | c e ← +1 → f(ind1-1, ind2-1) ← if goes -ve

0 + max[f(ind1-1, ind2), f(ind1, ind2-1)];

f(ind1, ind2) -ve means end of the strings.

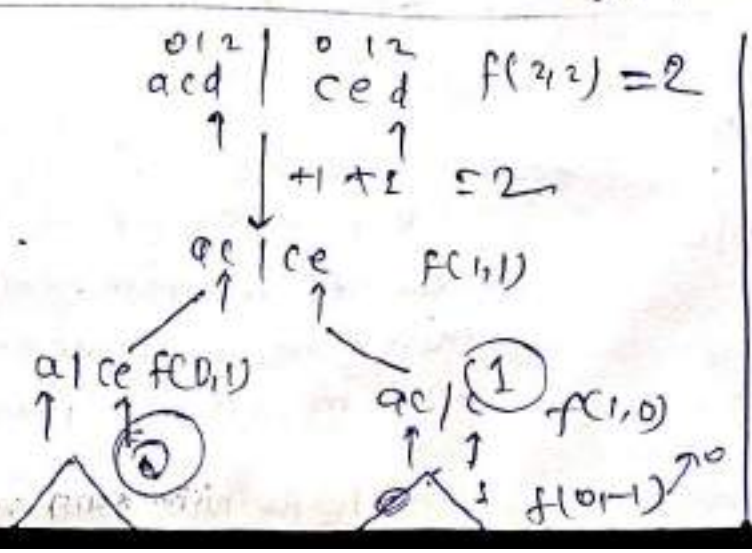
```
{
// Base case
if(ind1 < 0 || ind2 < 0)
    return 0;
```

Match

```
if(s1[ind1] == s2[ind2])
    return 1 + f(ind1-1, ind2-1);
```

No match

```
return 0 + max[f(ind1-1, ind2), f(ind1, ind2-1)];
```



Recursion $2^n \times 2^m$ ≈ exponential

↓ optimised if there are overlapping sorae problem then apply memoization.

Code :-

```
int f(int i, int j, string &s, string &t, vector<vector<int>> &dp)
{ if(i<0 || j<0)
    return 0;                    i==0  j==0
  if(dp[i][j] != -1) return dp[i][j];
  if(s[i] == t[j])

Tc. O(n+m)

DP-27 Longest Common Substring :-

S_1 = "abcjklp" S_2 = "acjlqp"

Should be consecutive

Let's
- matching
  $dp[i][j] = 1 + dp[i-1][j-1]$
- not matching
  $dp[i][j] = max(dp[i-1][j], dp[j][j-1])$

This will not work on substring

Let's take an example

acd | axd

This is consecutive so we don't dependent on the previous guys.

Breaking the consecutive rule

+1

ac | ax

a | ax

ac | a

+1

| ax

a | d

c | a

ac |

no need to do a break directly put 0

$dp[i][j] = 0$

abcd

abzd

		a	b	z	d
	0	1	2	3	4
0	0	0	0	0	0
a 1	0	1	0	0	0
b 2	0	0	2	0	0
c 3	0	0	0	0	0
d 4	0	0	0	0	1

The maximum value in the entire matrix.

Code

```
int lcs(string &s, string &t)
{
    int n = s.size();
    int m = t.size();
    vector<vector<int>> dp(n+1, vector<int>(m+1, 0));
    for(int j = 0; j<=m; j++)
        dp[0][j] = 0;
    for (int i=0; i<=n; i++)
        dp[i][0] = 0;
    int ans = 0;
    for (int i = 1; i<=n; i++)
    {
        for (int j = 1; j<=m; j++)
        {
            if( s[i-1] == t[j-1] )
            {
                dp[i][j] = 1 + dp[i-1][j-1];
                ans = max(ans, dp[i][j]);
            }
            else
                dp[i][j] = 0;
        }
    }
    return ans;
}
```

Space optimization :-

Code :-

```
int lcs(string &s, string &t)
{
    int n = s.size();
    int m = t.size();
    vector<int> prev(m+1, 0), cur(m+1, 0);
    int ans = 0;
    for(int i = 1; i <= n; i++)
    {
        for(int j = 1; j <= m; j++)
        {
            if(s[i-1] == t[j-1])
            {
                cur[j] = 1 + prev[j-1];
                ans = max(ans, cur[j]);
            }
            else
                cur[j] = 0;
        }
        prev = cur;
    }
    return ans;
}
```

DP-28 **longest palindromic subsequences :**

S = " bbbab"

→ ab
→ bb
→ bbb
→ bbbb — longest one
→ bab

Ans = 4 (length)

Brute force

Generate all the subsequences → Check for palindrom & pick up the longest.

S_1 = " babcbcab"

S_2 = " bacbcbab" — reverse of S_1 (order)

Just find lcs (S_1, rev(S_1))

Code :

```
int lcs (string s, string t)
{ int n = s.size();
  int m = t.size();
vector<vector<int>> dp(n+1, vector<int>(m+1, 0));
for(int j = 0; j<=m; j++) dp[0][j] = 0;
for(int i=0; i<=n; i++) dp[i][0] = 0;
for(int i = 1; i<=n; i++)
   { for(int j =1; j<=m; j++)
       if(s[i-1] == t[j-1])
          dp[i][j] = 1+dp[i-1][j-1];
       else
          dp[i][j] = max(dp[i-1][j], dp[i][j-1]
       }
     return dp[n][m];
   }
int longestPalindromeSubsequence (string s)
{ string t = s;
  reverse(t.begin(), t.end());
  return lcs(s,t);
}
```

DP-29 Minimum insertions to make a string palindrome:

prerequisite → LCS
→ LPS

S = "abcaa"

abcaa aa cba
reverse

max operation = len(S)

S + rev(S) — becomes palindrome.

aa bc baa ⟶ palindrom and min operation = 2

Hard Approach:-

keep the palindrome portion intact.

S = abcaa - a lot of palindrom so I will try to keep longest palindrome intact.

a b c a a — aaa.

a bc a ba a

we will rotate b not rotate then we will place copy of that in right part.

Code in my mind

n — longest palindromic subsequence

size of string.

Code :-

```
int minInsertion(string &str)
{ return str.size() - longestPalindromeSubsequence(str);
}
int longestPalindromeSubsequence(string s)
{string t = s;
 reverse(t.begin(), t.end());
 return lcs(s, t);
}

int lcs(string s, string t)
{ int n = s.size();
  int m = t.size();
vector<vector<int>> dp(n+1, vector<int>(m+1, 0));
for(int j=0; j<=m; j++) dp[0][j] = 0;
for(int i=0; i<=n; i++) dp[i][0] = 0;
for(int i=1; i<=n; i++)
    {for(int j=1; j<=m; j++)
      {if(s[i-1] == t[j-1])
         dp[i][j] = 1 + dp[i-1][j-1];
       else
         dp[i][j] = max(dp[i-1][j], dp[i][j-1]);
      }
    }
  return dp[n][m];
}
```

DP-80

Minimum insertion/deletion to convert string A to string B

str1 → "abcd" str2 = "anc"

Delete everything from str1 and insert each character from str2 to str1.

it takes str1.size() + str2.size operations.

Intution

what can I not touch

a b c d ⟶ anc
× ×

lets delete b & d

a c — 2 deletion

now insert n

anc — 1 insertion

3 operations

longest common subsequence.

deletions = n - len(lcs)
insertions = m - len(lcs)

n+m - 2*len(lcs) → Ans

Code :

```
int canYouMake(string &str, string &ptr)
{ return str.size() + ptr.size() - 2*lcs(str,ptr);
}
int lcs(string s, string t)
{ int n = s.size();
  int m = t.size();
```

Aashish Kumar Nayak

```
Vector<vector<int>> dp(n+1, vector<int>(m+1,0));
    for(int j=0; j<=m; j++)
        dp[0][j] = 0;
    for(int i=0; i<=n; i++)
        dp[i][0] = 0;

    for(int i=1; i<=n; i++)
    {  for(int j=1; j<=m; j++)
        {  if(s[i-1] == t[j-1])
            dp[i][j] = 1+dp[i-1][j-1];
           else
            dp[i][j] = max(dp[i-1][j], dp[i][j-1]);
        }
    }
    return dp[n][m];
}
```

DP-31 Shortest Common Supersequence :-

S_1 = "brute" S_2 = "groot"

"brutegroot" ← len = 10 this can be called common supersequence.

both string should be present in the ans string. and order has to be same.

~~"broot"~~ "bgruoote" — len = 8

S_1 = "bleed" S_2 = "blue"

"bleued"

fix our lengths

print #

Common guys should be taken only once

common guy in two string means LCS(—,—)

↓

it tells me longest common guys

"bgruoote"

(S1) (S2)

blue (#) goo

(n+m) − len(LCS)

print string

$s_1[i-1] == s[j-1]$

$dp[i][j] = 1 + dp$

we will create dp table.

LCS table

		0	1 (g)	2 (r)	3 (o)	4 (o)	5 (t)
	0	0	0	0	0	0	0
b	1	0	0	0	0	0	0
r	2	0	0	1	1	1	1
u	3	0	0	1	1	1	1
t	4	0	0	1	1	1	2
e	5	0	0	1	1	1	2

if not match max(i,j) = 1

common guys get added by 1

etouorbg

reverse ~~that~~ it

gbrouote → len(s)

DP-33. # Edit Distance

S_1 = "horse" S_2 = "ros"

1. Insert
2. Remove
3. Replace

The minimum no. of steps by which we can convert S_1 into S_2.

---

(1) Brute method: delete all characters from S_1 and then insert all characters from S_2 to S_1.

It will take $len(S_1) + len(S_2)$ steps

(2) method

replace

S_1 = "horse" S_2 = "ros"

replace h with r — rorse

remove r — rose

remove e — ros

It took 3 steps.

Example

S_1 = "intention" S_2 = "execution"

remove t — inention

replace i → e — enention

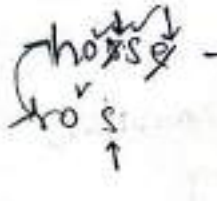
replace n → x — exention

insert u — execution

5 operations

Sol

String matching using recursion



→ If not matching

→ insert of the same character

→ delete & try finding somewhere else

→ replace & match.

Try all ways → Recursion

@Aashish Kumar Nayak

How to write Recurrence?

1. Express in terms of (i,j).
2. Explore all paths of matching.
3. Return min(all paths).
4. Base case.

f(i,j)

horse (i)
ros (j)

f(n-1, m-1) → min operation or to convert.

s1[0---i] to s2[0---j]

f(i,j)
{
if(s1[i] == s2[j])
return 0 + f(i-1,j-1); // if they are matching shrink both string and we don't require any steps.
}

1 + f(i, j-1); // insert
// if not matching i can insert

1 + f(i-1, j); // delete

1 + f(i-1, j-1); // replace

s1 gets exhausted

return (j+1) steps

horse
ros

f(-1, j) → min operations to convert empty string to a s2[0---j]

"" "ro"

if(i<0) return j+1;

if(j<0) return i+1; // insert

s2 gets exhausted

return (i+1) operations

s1 = "horse"
0 1 2

s2 = "ros"
-1 0 1 2

SC → O(N+M)

overlapping subproblem → memoize

After memoization

T.C. → O(N*M)

S.C → O(N×M) + O(N+m)

```
int editDistance(string &str1, string &str2, vector<vector<int>> &dp)
{ if( i<0 ) return j+1; // if( i==0) return j+1;
  if(j<0) return i+1; // if( j==0) return i;
    if(dp[i][j] != -1) return dp[i][j];
  if (s1[i] == s2[j]) return dp[i][j] = f(i-1, j-1, s1, s2,
  // s1[i-1] == s2[j-1]
  return dp[i][j] = 1 + min( f(i-1,j,s1,s2,dp), min(f(i, j-1, s1, s2, dp), f(i-1, j-1, s1, s2, dp));
}

int editdistance(string str1, string str2)
{ int n = str1.size();
  int m = str2.size();
  vector<vector<int>> dp(n, vector<int> (m, -1));
  return f(n-1, m-1, str1, str2, dp);
}
```

Tabulation :-

1. Base case ——— in order to avoid -ve +1 to everywhere
2. changing parameters
3. copy the recurrence

Code : ~~int f(int i~~
try to write Base cases.

f(0,j) i==0 return j — Here j can be anything.

Means for(j = 0 → m) dp[0][j] = j; // Base case 1

j==0 return i

for(i=0→n) dp[i][0] = i;

@Ashish Kumar Nayak

2. i = 1 — n

j = 1 — m

3. copy the recurance.

```
int editDistance(string s1, string s2)
{
    int n = s1.size();
    int m = s2.size();
    vector<vector<int>> dp(n+1, vector<int>(m+1, 0));
    for(int i = 0; i<=n; i++) dp[i][0] = i;
    for(int j = 0; j<=m; j++) dp[0][j] = j;
    for(int i = 1; i<=n; i++)
    {
        for(int j = 1; j<=m; j++)
        {
            if(s1[i-1] == s2[j-1])
                return dp[i][j] = dp[i-1][j-1];
            else
                dp[i][j] = 1 + min(dp[i-1][j], min(dp[i][j-1], dp[i-1][j-1]));
        }
    }
    return dp[n][m];
}
```

Note Space optimization

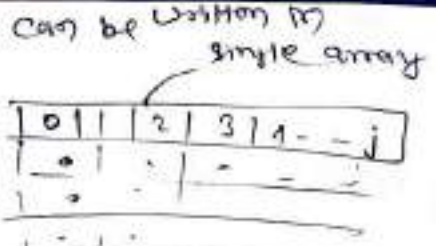
We can definitly optimise the space because there i-1, something like that is involved.

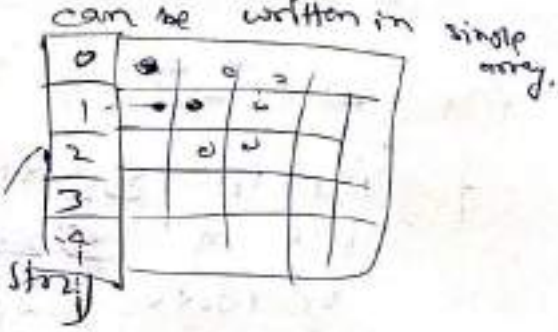
Date —

Base Cases:

dp[0][j] = j

dp[i][0] = i





```
int editDistance(string str1, string str2)
{
    int n = str1.size();
    int m = str2.size();
~~for(vector~~
    vector<int> prev(m+1, 0), cur(m+1, 0);
    for(int j=0; j<=m; j++)
        prev[j] = j;
    for(int i=1; i<=n; i++)
    {   cur[0] = i;
        for(int j=1; j<=m; j++)
        {   if(str1[i-1] == str2[j-1])
            ~~cur~~ cur[j] = prev[j-1];
            else
                cur[j] = 1+min( prev[j],
                                min(cur[j-1],
                                prev[j-1]));
        }
        prev = cur;
    }
    return prev[m];
}
```

DP-34 Wildcard Matching | DP on string (last problem)

s_1 = "?ay"
s_2 = "ray" } all three chars are matching → return true

? → matches with single char.
* → matches with sequence of length 0 or more.

s_1 = "a?b*?d"
s_2 = "acbxdefxd"
return true

s_1 = "a?b?d"
s_2 = "acbxdex"
return false

s_1 = "**abc?d"
s_2 = "abcxd"
return true

1st thing which comes in brain string matching → we can do using recurrance

Problem faced →
ab*?d
abdefxd
for this star we don't know how much of length of other string it will cover

so we have to try all possible ways → means recursion
len = 0, 1, 2, ...

so we will try string matching by recursion.

Rules to write Recurrance :-
1. Express (i, j)
2. Explore comparisons
3. out of all comparisons, if anyone can we return true f(n-1, m-1) - | @ashish kumar Nagar

s1[0...-1]
s2[0...6]

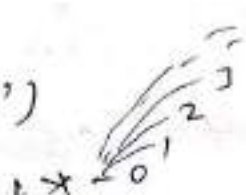
f(m-1, n-1) →
f(4, 6) → (T/F)

0	1	2	3	4
a	b	*	c	d

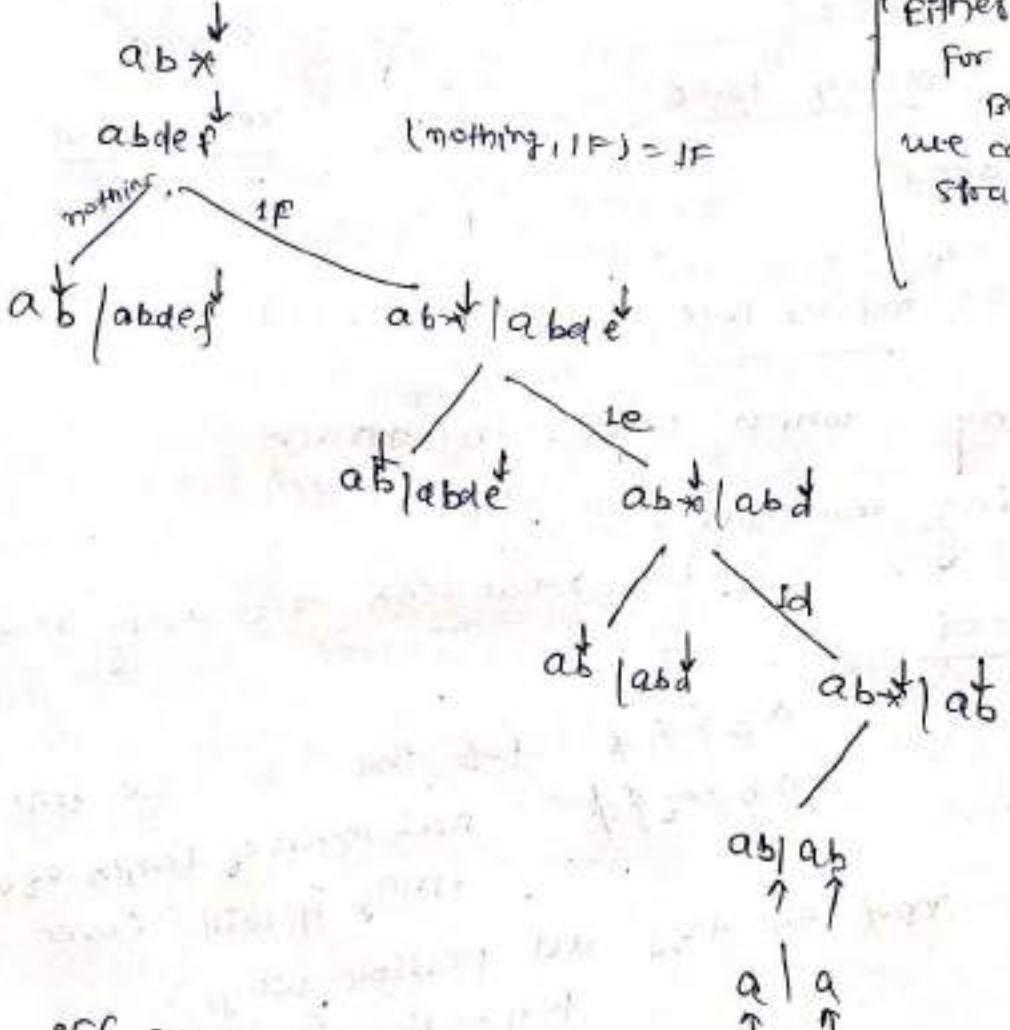
a	b	d	e	f	c	d
0	1	2	3	4	5	6

IF(s1[i] == s2[j] || s1[j] == '?')

return f(i-1, j-1)



Either we can write for loop
But we can do this in straight forward recursion



if(s1[i] == '*')

return f(i-1, j) or f(i, j-1)

return false;

Now analyze the Base case

Base case → return true/false

Either S_1 gets exhausted

S_1 → has no } Both are exhausted
S_2 → has no

if (i<0 && j<0) return true

return true.

only S_1 is get exhausted

if (i<0 && j>=0).

return false

if (j<0 && i>=0) — only S_2 is get exhausted.

if S_1 is left it has to be all "*"

for (ll i=0 → i)

if (s1[ii] != '*')

return false

return true.

} f(i,j)

if(i<0 && j<0) return true

if(i<0 && j>=0) return false

if(j<0 && i>=0) for (ll (——— ..)

Recursion

T.C. — O(exponential)

S.C. — O(N+M)

int f(int ind, int buy, int cap, vector<int> &prices
int n, vector<vector<vector<int>>> &dp)
{
  if(ind == n || cap == 0)
      return 0;
  if(buy)
  {
    return dp[ind][buy][cap] = max[-prices[ind] + f(ind+1, 0, cap, prices, n, dp)
                                   0 + f(ind+1, 1, cap, prices, n, dp)];
  }
  return dp[ind][buy][cap] = max[prices[ind] + f(ind+1, 1, cap-1, prices, n, dp)
                                 0 + f(ind+1, 0, cap, prices, n, dp)];
}
int Maxprofit(vector<int> &prices, int n)
{ vector<vector<vector<int>>> dp(n,
  vector<vector<int>>(2, vector<int>(3, -1)));
  return f(0, 1, 2, prices, n, dp);
}
```

Tabulation

① Base case
② changing parameter ind, Buy, cap
③ copy the recurance

④
```
if( cap == 0 || ind == n)
        return 0;
```

if (cap == 0)
ind & Buy can be anything
ind: 0 → n-1
Buy: 0 → 1

if (ind == n)
cap & Buy can be anything
cap: 0 → 2
Buy: 0 → 1

```
for( ind=0 → n-1)
    for (buy → 0 → 1)
        dp[ind][buy][0] = 0

for (buy = 0 → 1)
    for (cap = 0 → 2)
        dp[n][buy][cap] = 0
```

⑤
ind : run in reverse order
ind: n-1 → 0
buy → 0 → 1
cap → 0 → 2

⑥ Answer will be initial call i.e dp[0][1][2]

```
int maxProfit(vector<int> & prices, int n)
{ vector<vector<vector<int>>> dp(n, vector<vector<int>>(2, vector<int>(3,0)));
                                  // already dp is full with 0.
```

So we don't write any base cases. If there would something different like 1, 0 then we may write

```
for(int ind=n-1; ind>=0; ind--)
    { for(int buy = 0; buy<=1; buy++)
        { for(int cap=1; cap<=2; cap++)   // ignore 0.
            {
              if(buy == 1)
             {
dp[ind][buy][cap] = max(-prices[ind] + dp[ind+1][0][cap],
                        0 + dp[ind+1][1][cap]);
            }
          else
            {
dp[ind][buy][cap] = max( price[ind] + dp[ind+1][1][cap-1],
                         0 + dp[ind+1][0][cap]);
            }
        }
    }
  return dp[0][1][2];
}
```

DP-40 Buy and sell stocks with Transaction fee

DP on stocks
6th problem

prices[] = {1, 3, 2, 8, 4, 9} fee = 2

7-2 + 5-2 = 12-4 = (8) Net profit.

```
f( ind, buy)
{
 if( ind == 0 ) return 0;
 if(buy == 1)
   max( -price[ind] -fee + f(ind+1, 0), 0 + f(ind+1, 1));
 else
   max( price[ind] - fee + f(ind+1, 1), 0 + f( ind+1, 0));
```

OR

After the sell is done deduct the fee or we can also deduct the fee during buying.

Code:

```
int maximumprofit( int n, int fee, vector<int> &values)
{ int aheadNotBuy, aheadBuy, curBuy, curNotBuy;
  aheadbuy aheadNotbuy = aheadbuy = 0;
 for( int ind= n-1; ind>=0; ind--)
  {  //sell
    curNotbuy = max(values[ind] + aheadbuy, 0 + aheadNotbuy);
 // buy
 curbuy = max(-values[ind] - fee + aheadBuy, 0 + aheadBuy);
    aheadBuy = curBuy;
    aheadNotBuy = curNotBuy;
  }
 return aheadBuy;
}
```

@Ashish Kumar Nayak

DP-41 Longest increasing Subsequence

arr[] : [10, 9, 2, 5, 3, 7, 101, 18]

{2, 3, 7, 101} → len=4

{2, 3, 7, 18} → len=4

arr[] = {8, 8, 8}

{8} → len = 1

Brute force

Let's try out various subsequences → power set (or) Recursion

(2^n) exponential

Check for increase

Store the longest

In order to generate all subsequences.

Trying all ways → Recursion

[10, ✗]

prev=10 to check

Rearrange

(i) Express everything in terms of indexes

(ii) Explore all possibilities in subsequence — ✓ ✗

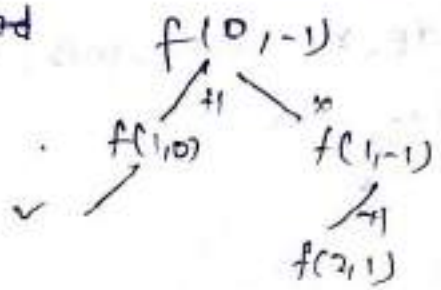
(iii) Take the max length

f(ind, prev_ind)

f(0,-1) → length of LIS starting from 0.

f(0,0) → length of LIS starting from 3rd index whose previous index is 0. → prev

f(ind)



Base case :-

```
if( ind == n)
    return 0;
```

~~Recu~~ Recursion -

T.C. $O(2^n)$ for every index we have 2 options i.e $O(2^n)$ .. S.C - $O(N)$

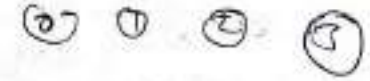
take / not-take

↓ overlapping sub-problem

Memoization

f(ind, prev_ind)

Co-ordinate change :-



T.C. - $O(N \times N)$

S.C - $O(N \times N) + O(N)$

Code :-

```
int f(int ind, int prev_ind, int arr[], int n, vector<vector<int>>& dp)
{
    if( ind == n) return 0;
    if( dp[ind][prev_ind+1] != -1 ) return dp[ind][prev_ind+1];
    int len = 0 + f(ind+1, prev_ind, arr, n, dp);
    if( prev_ind == -1 || arr[ind] > arr[prev_ind])
    {
        len = max( len, 1 + f(ind+1, ind, arr, n, dp));
    }
    return dp[ind][prev_ind+1] = len;
}
int longestIncreasingSubsequence( int arr[], int n)
{
    vector<vector<int>> dp(n, vector<int>(n+1, -1));
    return f(0, -1, arr, n, dp);
}
```

Tabulation :-

Rules.

① Base case ~~~ dp[n][n+1] = 0
∵ we already assign 0 to our so no need to write base case.

② Changing parameter
- ind = n-1 → 0
- prev_ind = ind-1 → -1

③ copy the recurrence follow coordinated shift.

Code :-

```
int longestIncreasingSubsequence(int arr[], int n)
{
  vector<vector<int>> dp(n+1, vector<int>(n+1, 0));
  for(int ind = n-1; ind>=0; ind--)
  {
    for(int prev_ind = ind-1; prev_ind>=-1; prev_ind--)
    {
      int len = 0 + dp[ind+1][prev_ind+1];
      if(prev_ind==-1 || arr[ind] > arr[prev_ind])
      {
        len = max(len, 1+dp[ind+1][ind+1]);
      }
      dp[ind][prev_ind+1] = len;
    }
  }
  return dp[0][-1+1];
}
```

Space optimization :-

@Aashish Kumar Nayak

```
int longestIncreasingSubsequence(int arr[], int n)
{
    vector<int> next(n+1,0), cur(n+1,0);
    for(int ind = n-1; ind >= 0; ind--)
    {
        for(int prev_ind = ind-1; prev_ind >= -1; prev_ind--)
        {
            int len = 0 + next[prev_ind+1];
            if(prev_ind == -1 || arr[ind] > arr[prev_ind])
            {
                len = max(len, 1 + next[ind+1]);
            }
            cur[prev_ind+1] = len;
        }
        next = cur;
    }
    return next[-1+1];
}
```

T.C. - $O(N^2)$

S.C. - $O(N) \times 2$

Example

5	4	11	1	16	8

dp[n]

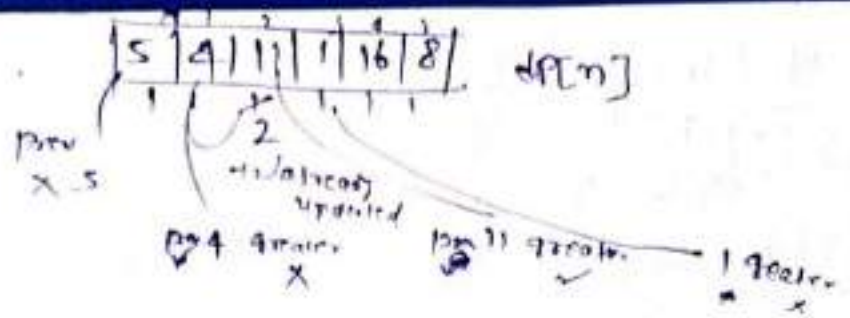
dp[i] → signifies the longest increasing subsequence that ends at index i.

{5, 16}

{3, 11, 16}

Ans → max of all dp indexes.

$\max_{i=0 \text{ to } n-1} (dp[i])$



```
for(ind = 0 → n-1)
    for(prev = 0 → ind-1)
        if(arr[prev] < arr[ind])
            dp[ind] = max(1+dp[prev], dp[ind]);
```

Code :-

```
fn: longestIncreasingSubsequence(int arr[], int n)
{
    vector<int> dp(n,1);
    int maxi = 1;
    for(int i = 0; i<n; i++)
    {
        for(int prev = 0; prev<i; prev++)
        {
            if(arr[prev] < arr[i])
            {
                dp[i] = max(dp[i], 1+dp[prev]);
            }
        }
        maxi = max(maxi, dp[i]);
    }
    return maxi;
}
```

T.C. - O(N²) — This solution will be required if we want to trace the LIS.

S.C. - O(N)

DP-42

print the subsequence

5	7	11	1	16	8
1	2	2	1	3	3	dp

| 0 | 1 | 2 | 0 | 4 | 5 | hash

4 → 2 → 0

16 11 5

reverse it → 5, 11, 16

Code :-

```
int longestIncreasingSubsequence(int arr[], int n)
{
  vector<int> dp(n,1), hash(n);
  int maxi = 1;
  int lastIndex = 0;
  for(int i=0; i<n; i++)
  {
    hash[i] = i;
    for(int prev=0; prev<i; prev++)
    {
      if(arr[prev] < arr[i] && 1+dp[prev] > dp[i])
      {
        dp[i] = 1+dp[prev];
        hash[i] = prev;
      }
    }
    if(dp[i] > maxi)
    {
      maxi = dp[i];
      lastIndex = i;
    }
  }
}
```

```
vector<int> temp;
temp.push_back(arr[lastIndex]);
while(hash[lastIndex] != lastIndex)
    {
        lastIndex = hash[lastIndex];
        temp.push_back(arr[lastIndex]);
    }
reverse(temp.begin(), temp.end());
for(auto it: temp)
    cout<<it<<" ";
cout<<endl;
return maxi;
}
```

T.C. - $O(N^2)$

$O(N)$

DP-43 Longest Increasing Subsequence

In this lecture we will use Binary search

LIS using Binary search

[1, 7, 8, 4, 5, 6, -1, 9]

Increasing subsequences are

1, 4, 5, 6, 9 — longest

Recursion
Memoization
space optimization
Tabulation
Algorithmic approach

T.C — $O(N^2)$
S.C — $O(N)$

Approach :- 1 ~~, 4, 6, 9~~

Try to go every element and form subsequence

[1, 7, 8, 4, 5, 6, -1, 9]

[1, 7, 8, 9] len=4

[1, 4, 5, 6, 9] len=5 → longest

[-1, 9] len=2

But a lot of space will be consumed

Intuition

- To avoid space we will overwrite instead of creating new array.

[1, 7, 8, 4, 5, 6, -1, 9]

[1, 4, 5, 6, 9]

[1, 4 — instead of making [1, 4 we will replace new overwrite in 1st array Replace 4 with 7

arr[] = {1, 4, 5, 4, 2, 8}

[1, 4, 5, 8] len = 4 — space has been optimized.

@Aashish Kumar Nayak

Binary Element el -> arr[i]

if(find arr[i] .

else find 1st greater of arr[i]

ed.

lower_bound( )

→ it gives you 1st pointer of arr[i]
or
first index > arr[i]

Code :-

```
int longestIncreasingSubsequence(int arr[], int n)
  {
    vector<int> temp;
    temp.push_back(arr[0]); int len = 1;
    for(int i=1; i<n; i++)
      { if(arr[i] > temp.back())
          { temp.push_back(arr[i]);
            len++;
          }
        else
          {
            int ind = lower_bound(temp.begin(), temp.end(),
                                  arr[i]);
            temp[ind] = arr[i];
          }
      }
    return temp.size();
  }  return len; // len will take less space than temp
```

lower bound. size()

T.C. - O(N log N)
S.C. - O(N)

@Aashish Kumar Nayak

DP-44 Largest Divisible Subset | longest increasing subsequence

© Aashish Kumar Nayak

arr[] = {1, 16, 7, 8, 4}

{1, 16, 8} — subsequence

{1, 8, 16}
{1, 16, 8}
{1, 7, 16}
} subset not necessary to follow the order.

arr[i] % arr[j] == 0
or arr[j] % arr[i] == 0

lets take an example

{16, 8, 4} (16,8) (8,4) (16,4) Every pair is divisible

{1, 16, 8, 4} (1,16), (1,8), (1,4), (16,8), (16,4), (8,4)
All the pairs are divisible this can be possible ans

len = 4

print any answer you can jumble it and return.

{1,16,8,4} ✓ or {4, 16, 1, 8} ✓ ...

intution

sort the array

{1, 4, 7, 8, 16}

{1, 4, 8, 16}

4 is divisible by 1 so store it
7 is not divisible by 4
8 is divisible by 4 & and also it is divisible by 4 then it will automatically divisible by 1 or previous elements.

len=4 this

we will get longest divisible increasing subsequence.

LIS code :-

```
for(i=1; i<n; i++)
  { for(j=0; j<i; j++)
      { if(arr[i] % arr[j] == 0)
          if(~~arr[i] < arr[j]~~ && dp[i] < dp[j]+1)
              dp[i] = dp[j]+1
              hash[i] = j
      }
```

because it is already sorted just change arr[i] % arr[j] or arr[j] % arr[i];

Code :-

```
vector<int> divisibleSet(vector<int> &arr)
{ int n = arr.size();
  vector<int> dp(n,1), hash(n);
  int maxi = 1;
  int lastIndex = 0;
  sort(arr.begin(), arr.end());
  for(int i=0; i<n; i++)
  { hash[i] = i;
    for(int prev=0; prev<i; prev++)
    { if(arr[i] % arr[prev] == 0 && 1+dp[prev] > dp[i])
      { dp[i] = 1 + dp[prev];
        hash[i] = prev;
      }
    }
    if(dp[i] > maxi)
    { maxi = dp[i];
      lastIndex = i;
    }
  }
  vector<int> temp;
  temp.push_back(arr[lastIndex]);
  while(hash[lastIndex] != lastIndex)
  { lastIndex = hash[lastIndex];
    temp.push_back(arr[lastIndex]);
  }
  reverse(temp.begin(), temp.end());
  return;
}
```

T.C. $O(N^2)$
S.C - $O(N)$

@Aashish kumar Nayak

DP-45 Longest string Chain | longest increasing subsequence

words[] = {"a", "b", "ba", "bca", "bda", "bdca"}

{a, ba, bda} add b, add d

{b, ba, bca} add a, add c

{a, ba, bca}

for(i=1 → n)
{ for (j=0; j<i; j++) Compare(arr[i], arr[j])
{
if(~~arr[i] > arr[j]~~ && dp[j]+1 > dp[i])
{ dp[i] = dp[j]+1;
}
maxi = max(maxi, dp[i]);
}
return maxi;

one line change.

bdca

bda

assume

arr[i] bcda ← ta → arr[j] bcd

bcd

if both pointers reaches its end means match.

In this question there is sequence NOT sub-sequence so we can pick from any where.

["xbc", "pcxbcr", "xb", "[xbc", "pcxbc"]
(2) (5) (1) (3) (4)

We will sort this array according to the length.

DP-47 Number of longest increasing subsequence

arr[] = {1, 3, 5, 4, 7}

{1, 3, 4, 7}
{1, 3, 5, 7}
— ② subsequences of longest length

arr[] → {1, 5, 4, 3, 2, 8, 7, 10, 8, 9}
(8 attached with 1)

dp[] → 1 x2 x2 x2 x2 x2 3
cnt[] → 1 1 1 1 1 2 1 3 4 5

1, 5

4 itself of length 1 and cnt is 1, I can be attached with 4 so increase cnt by 1 and dp remain 1

1, 5, 7 → 1, 6, 7
1, 4, 7 → 5, 6, 7
1, 3, 7 → 4, 6, 7
1, 2, 3 → 3, 6, 7
3, 6, 7 → 2, 6, 1

{1, 3, 5, 4, 7}
dp[] = 1, 2, 3, 3, 4
cnt[] = 1, 1, 1, 1, 2

Code :-

```
int findNumberOfLIS(vector<int> &arr)
{ vector<int> dp(n,1), cnt(n,1);
  int maxi = 1; int n = arr.size();
  for(int i = 0; i<n; i++)
  { for(int prev = 0; prev<i; prev++)
    { if(arr[prev] < arr[i] && 1+dp[prev] > dp[i])
      { dp[i] = 1+dp[prev];
        cnt[i] = cnt[j];
      }
```

@Rashish Kumar Nayak

```
else if (arr[prev] < arr[i] && 1 + dp[prev] == dp[i])
{
    cnt[i] += cnt[prev];
}
}
maxi = max(maxi, dp[i]);
}
int cnt = 0; int nos = 0;
for(int i = 0; i < n; i++)
{ if(dp[i] == maxi)
    nos += cnt[i];
}
return nos;
}
```

3 subproblems take the minimum no. of cuts.

take this one

1 + (abcbadcede)

1 + (dcede)

Getting a recurrence :-

1. Express everything in terms of index.
2. Express all the ~~ways~~ possibilities.
3. Take the min of all possibilities
4. Write the base case.

Give me the min. cut to make all substring palindrome.

@Ashish Kumar Nayak

```
f(i)
{ if( i == n) return 0;
        temp = "";   if(dp[i] != -1) return dp[i];
for(j=i ; j<n; j++)
    {
      temp += s[j];
          if( isPalindrome(temp))
              cost = 1+f(j+1);
              minCost = min(minCost, cost);
    }
}       return minCost;
```

temp = b
temp = ba
temp = bab

dp[i] =>

Recursion → T.C. = O(Exponential)

↓ Memoization

Changing parameter
0 → N
dp[N]

Code :

```
int palindromePartitioning(string str)
{ int n = str.size();
  vector<int> dp(n,-1);
  return f(0, n, str, dp)-1;
}
int f(int i, int n, string &str, vector<int> &dp)
{ if(i == n) return 0;
  if(dp[i] != -1) return dp[i];
  int minCost = INT_MAX;
  for(int j=i; j<n; j++)
    { if(ispalindrome(i,j,str))
      { int cost = 1+ f(j+1, n, str, dp);
        minCost = min(minCost, cost);
      }
  }return dp[i] = minCost;
}
```

```
bool ispalindrome(int i, int j, string s)
{ while(i<j)
  { if(s[i] != s[j])
      return false;
    i++;
    j--;
  }
  return true;
}
```

T.C. $O(N) \times O(N) = O(N^2)$

S.C. $O(N) + O(N)$ Ass.

Tabulation :-

int (1) Base case (i == n) → 0

(2) i = n-1 → 0 dp[n] = 0;

(3) Copy the recurrence

```
int palindromepartitioning(string str)
{ int n = str.size();
  vector<int> dp(n+1);
  dp[n] = 0;
  for(int i=n-1; i>=0; i--)
  { int mincost = INT_MAX;
    for(int j=i; j<n; j++)
    { if(ispalindrome(i, j, str))
      { int cost = 1 + dp[j+1];
        mincost = min(mincost, cost);
      }
    }
    dp[i] = mincost;
  }
  return dp[0]-1;
}
```

T.C. - $O(N^2)$

S.C - $O(N)$

DP-54 Partition Array for Maximum Sum / Front Partition

arr[] = [1, 15, 7, 9, 2, 5, 10] K = 3
(0 1 2 3 4 5 6)

[15, 15, 15, 9, 9, 9, 10, 10]

Sum = 77

all elements of partition converted into max element

[1 15 7 | 9 | 2 5 10]
[15 15 15 9 10 10 10]

sm = 84 ↑↑

front partition logic ⟷ Maximum

We have various ways → Try recursion

Rules :

(i) Express everything in terms of index.
(ii) Try partition possible from that index.
(iii) Take the best partition.

[0: 1, 1: 15, 2: 7, 3: 9, 4: 2, 5: 5, 6: 10]
↑ ind

f(3)

Base case : Try out all partitions from that index

f(0)
give me the max sum if we have the array from 0.

Base case :
Whenever we are crossing the n we will stop

```
f(ind)
{
    Base case:
    maxAns = INT_MIN;
    len = 0; maxi = INT_MIN;
    for(j = ind; j < min(n, ind+k); j++)
    {
        len++;
        maxi = max(maxi, arr[j]);
        sum = (len x max) + f(j+1);
        MaxAns = max(MaxAns, sum);
    }
    return MaxAns;
}
```

15, 15 7 5
j=1 j=2 j=3

T.C. O(exponential)
↓ Memoization
1 changing parameter
T.C. - O(N) x O(K)
S.C. - O(N) + O(N)

```
int f(int ind, vector<int> &num, int k, vector<vector<int>> &dp)
{
    if(ind == num.size())
        return 0;
    int len = 0; if(dp[ind] != -1) return dp[ind];
    int maxi = INT_MAX;
    int maxAns = INT_MIN;
    for(int j = ind; j < min(ind+k, n); j++)
    {
        len++;
        maxi = max(maxi, num[j]);
        int sum = len * maxi + f(j+1, num, k, dp);
        maxAns = max(maxAns, sum);
    }
    return dp[ind] = maxAns;
}

int maximumSubarray(vector<int> &num, int k)
{ int n = num.size();
  vector<int> dp(n, -1);
  return f(0, num, k, dp);
}
```

Tabulation :-

① Base case

if(ind == n) return 0

i.e dp[n] = 0

② Changing Variable

0 to n (this time opposite) ind : n-1 to 0

③ copy the recursion.

@Ashish Kumar Nayak

```
int maximumSubarray(vector<int> &num, int k)
{  int n = num.size();
   vector<int> dp(n+1,0);
   for(int ind = n-1; ind>=0; ind--)
      {  int len = 0;
         int maxi = INT_MIN;
         int maxAns = INT_MIN;
       for(int j= ind; j< min(ind+k, n); j++)
           {  len++;
            maxi = max(maxi, num[j]);
            int sum = len * maxi + dp[j+1];
            maxAns = max(maxAns, sum);
           }
         dp[ind] = maxAns;
      }
      return dp[0];
}
```

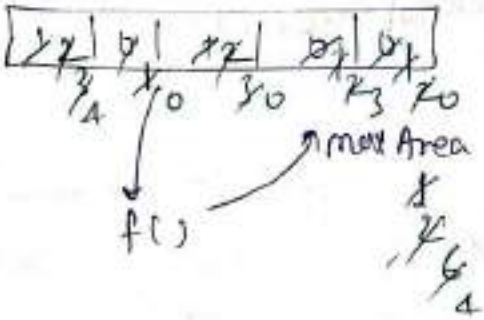
@Aashish Kumar Nayak

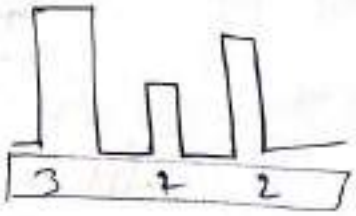
DP-55 Maximum Rectangle area with all 1's / pp on Rectangle

1	0	1	0	0
1	0	1	1	1
1	1	1	1	1
1	0	0	1	0

$2 \times 3 = 6$ (maximum)

We will solve this question using Histogram





if we find 0 then it becomes 0
else previous height will be added.

max = 6

Code :-

```
int maximalAreaOfSubmatrixOfAll(vector<vector<int>> &mat,
                                int n, int m)
{
    int maxArea = 0;
    vector<int> height(m, 0);
    for(int i=0; i<n; i++)
    {
        for(int j = 0; j<m; j++)
        {
            if(mat[i][j] == 1)
                height[j]++;
            else
                height[j] = 0;
        }
        int area = largestRectangleArea(height);
        maxArea = max(area, maxArea);
    }
    return maxArea;
}
```

@ Ashish Kumar Nayak

```
int largestRectangleArea(vector<int>& histo)
{
    stack<int> st;
    int maxA = 0;
    int n = histo.size();
    for(int i = 0; i <= n; i++)
    {
        while(!st.empty() && (i == n || histo[st.top()] >= histo[i]))
        {
            int height = histo[st.top()];
            st.pop();
            int width;
            if(st.empty())
                width = i;
            else
                width = i - st.top() - 1;
            maxA = max(maxA, width * height);
        }
        st.push(i);
    }
    return maxA;
}
```

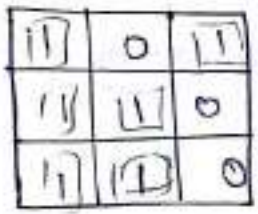
T.C. O(N X (m+n))

S.C. O(N)

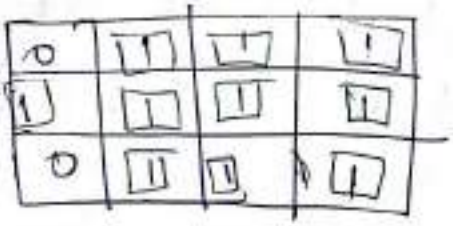
We are trying to remember the heights that why this is kept in dp.

@Ashish Kumar Nayak

DP-56 Count No. of square Submatrices

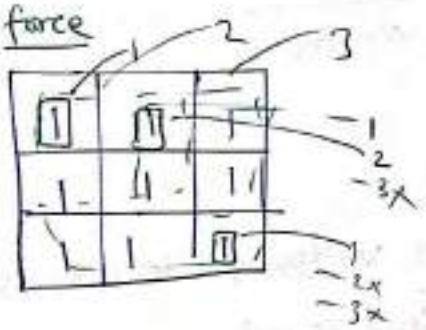


Size 1 — 6
Size 2 — 1



size 1 — 10
size 2 — 4
size 3 — 1

Brute force



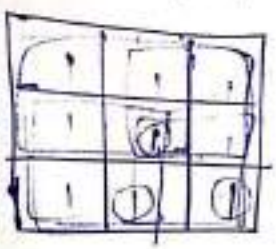
We can do better using dp.

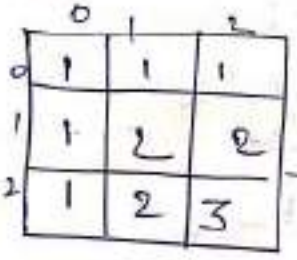
Try to create dp of similar size

dp[i][j]

How many squares end at (i,j) Right Bottom at (i,j)

Try

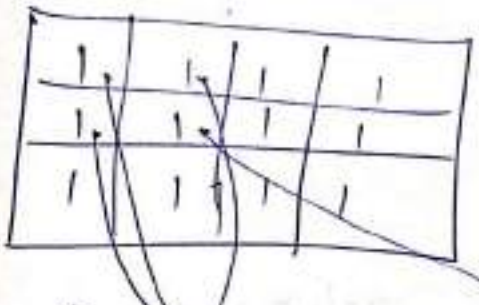




1 sq he himself
+ he is right most bottom two
= 2

sum all of them we will get our ans.

but How we will fill this array.



take minimal of three and add 1

first row and first column they themselves are sq. of size 1.

min = 2+1 = 3

if there 3 are 1 and if this is 1.
then it will form square of size 2.

Now add of of them.
and return the ans.

@Aashish Kumar Nayak

1	1	0
1	1	1
1	1	0

→

1	1	0
1	2	1
1	2	0

min:0 or 1 — Now add all of them.

min(1,1,1) = 1+1 = 2

dp[i][j] = min[dp[i-1][j], dp[i-1][j-1], dp[i][j-1]] + 1

upper. diagonal left.

Code:-

```
int countSquares( int n, int m, vector<vector<int>> &arr)
{ vector<vector<int>> dp(n, vector<int>(m,0));
   for (int j=0; j<m; j++)
       dp[0][j] = arr[0][j];
   for(int i=0 ; i<n; i++
       dp[i][0] = arr[i][0];
   for( int i=1; i<n;  i++)
     { for(int j=1; j<m; j++)
        { if(arr[i][j] == 0)
            dp[i][j] = 0;
          else
            {
            dp[i][j] = 1 + min(dp[i-1][j], min(dp[i-1][j-1],
                                               dp[i][j-1]));
            }
        }
     }
   int sum = 0;
   for(int i=0; i<n; i++) {
      for(int j=0; j<m; j++) {
        sum += dp[i][j]; } } return sum; }
```

add all of them in dp and return.
